Addition to earlier epiphany

It suddenly seems clear to me that, since there was no hole in the floor where the amplifier was removed from the craft, and since that Bob said that there was an amplifier and a separate emitter with the reactor in the lab, and he said that there was no connection between the emitter and the other components, I now believe that there was a waveguide from the reactor in the lab to the amplifier in the lab and that the emitter was not connected to either one of the previous two with any hardware. This would explain how Bob would say that there was no connection between components and yet still reconcile the fact that they did substitute wave guides for the ones that were provided in the craft. This would also explain why he confirmed that my drawing was more or less correct when I showed him a connection between the reactor and the amplifier.

It might also reconcile the fact that Bob sometimes said that the equipment in the lab on the bench was the same pewter color as the rest of the craft while other times he said that the emitters were black or a very very dark color. Sometimes Bob gets the amplifiers and emitters jumbled up when he is talking about them and he admits that freely even though he knows what he means to say.
